Algebra Calculator—Symbolab

For multiplication, use the * symbol. A ^ symbol is not necessary when multiplying a number by a variable. For instance: 2 * x can also be entered as 2x. Similarly, 2 * (x + 5) can also be entered as 2(x + 5). The ^ is also optional when multiplying with parentheses, example: (x + 1)(x - 1). Order of Operations

If a²(4-2b)+b²(4-2a)-c²(4-2)=0, then what is the value ...

Start with: a² + b² = c². Put in what we know: 12 + 12 = c². Calculate squares: 1 + 1 = c². 1+1=2: 2 = c². Swap sides: c² = 2. Square root of both sides: c = √2. Which is about: c = 1.4142... It works the other way around, too: when the three sides of a triangle make a² + b² = c², then the triangle is right angled.

Pythagoras Theorem—MATH

The exponents on a and b always add up to 1/2, and the numeric coefficient "1/2 choose n" (similar in construction to m-choose-n for m integer, although without the usual combinatorial applications) has a falling factorial in the numerator starting with factor 1/2 and with each factor 1 less than the previous, up to n factors, with the ordinary n! in the denominator.
