Because the activation energy is the energy hill between reactants and products, enzymes decreasing the size of the hill also decreases the amount of energy needed for reactions to go in either direction. A smaller energy hill allows reactants and products to overcome the barrier quicker, resulting a faster reaction rate.

10.7: The Effect of pH on Enzyme Kinetics Enzymes are affected by changes in pH. The most favorable pH value - the point where the enzyme is most active - is known as the optimum pH. 10.8: The Effect of Temperature on Enzyme Kinetics Enzyme structures unfold (denature) when heated or exposed to chemical denaturants and this disruption to the structure typically causes a loss of activity.

Voiceover: Today we're gonna talk about Michaelis-Menten kinetics and the steady-state. First, let's review the idea that enzymes make reactions go faster and that we can divide the enzymes catalysis into two steps. First the binding of enzyme to substrate and second the formation of products. Each of these reactions has its own rate.

ENZYME KINETICS

Enzyme kinetics combined with related approaches can show how the functional properties of a mutant or engineered enzyme compare to those of its wild-type parent. Many of the equations of enzyme kinetics are also applicable to other saturable biological processes, for example, membrane transport and receptor-ligand interactions.
