The Oxford Handbook of Social Influence restores this important field to its once preeminent position within social psychology. Editors Harkins, Williams, and Burger lead a team of leading scholars as they explore a variety of topics within social influence, seamlessly incorporating a range of analyses (including intrapersonal, interpersonal, and intragroup), and examine critical theories and the role of social influence in applied settings today.

In the third edition of her popular text, *Sex Differences in Cognitive Abilities*, Diane Halpern tackles fundamental questions about the meaning of sex differences in cognition and why people are so afraid of the differences. She provides a comprehensive context for understanding the theories and research on this controversial topic. The author employs the psychobiosocial model of cognition to negotiate a cease fire on the nature-nurture wars and offers a more holistic and

Read Online Influence Of Gender Difference On Reading Habit And

integrative conceptualization of the forces that make people unique. This new edition reflects the explosion of theories and research in the area over the past several years. New techniques for peering into the human brain have changed the nature of the questions being asked and the kinds of answers that can be expected. There have been surprising new findings on the influence of sex hormones on cognitive abilities across the life span, as well as an increasing number of studies examining how attention paid to category variables such as one's sex, race, or age affects unconscious and automatic cognitive processes. Written in a clear, engaging style, this new edition takes a refreshing look at the science and politics of cognitive sex differences. Although it is a comprehensive and up-to-date synthesis of scientific theory and research into how, why, when, and to what extent females and males differ in intellectual abilities, it conveys complex ideas and interrelationships among variables in an engrossing and understandable manner, bridging the gap between sensationalized 'pop' literature and highly technical scientific journals. Halpern's thought-provoking perspectives on this controversial topic will be of interest to students and professionals alike. [features used for book mailer] FEATURES: *Includes new information about sex differences and similarities in the brain, the role of sex hormones on cognition (including exciting new work on hormone replacement therapy during menopause), new perspectives from evolutionary psychology, the way stereotypes and other group-based expectations unconsciously and automatically influence thought, the influence of pervasive sex-differentiated child rearing and other sex role effects, and understanding how research is conducted and interpreted. *Takes a cognitive process approach that examines similarities and differences in visuospatial working memory, verbal working memory, long-term acquisition and retrieval, sensation and perception, and other stages in information processing. *Provides a developmental analysis of sex differences and similarities in cognition extending from the early prenatal phase into very old age. *Tackles both political and scientific issues and explains how they influence each other--readers are warned that science is not value-free. *Uses cross-cultural data and warns readers about the limitations on conclusions that have not been assessed in multiple cultures. *Includes many new figures and tables that summarize complex issues and provide section reviews. It is a beautifully written book by a master teacher who really cares about presenting a clear and honest picture of contemporary psychology's most politicized topic.

Let's face it, say Barash and Lipton: Males and females, boys and girls, men and women are different. To be sure, these differences are often heightened by distinctions in learning, cultural tradition, and social expectation, but underpinning them all is a fundamental difference that derives from biology. Throughout the natural world, males are those creatures that make sperm; females make eggs. The oft-noticed "gender gap" derives, in turn, from this "gamete gap." In *Gender Gap*, Barash and Lipton (husband and wife, professor and physician, biologist and psychiatrist) explain the evolutionary aspects of male-female differences.

The development of gender differences as an area of research has been rapid over the last decades. Varieties of studies have focused on the gender differences as well as the similarities of women and men. The common purpose of the research attempt is to find out the possibilities and even the consequences of gender differences and the impact on human beings

Read Online Influence Of Gender Difference On Reading Habit And

on one side, and social and cultural environment on the other. This book is an attempt to provide theoretical and empirical framework to better understand gender differences in various contexts and on different levels. Therefore, the contributions cover an array of themes that span from an individual level to an organizational and societal level.

Women's health and men's health differ in a variety of ways--women live longer on average, for example, but tend to be sicker as well. Whereas some of these distinctions are based solely on gender, there is growing awareness that the environment and related factors may play a role in creating health status differences between men and women. Various factors, such as genetics and hormones, may account for gender differences in susceptibility to environmental factors. In 1996 the Office for Research on Women's Health at the National Institutes of Health asked the Institute of Medicine to conduct a workshop study to review some of the current federal research programs devoted to women's health and to clarify the state of knowledge regarding gender-related differences in susceptibility. This book contains a general outline of research needs, a summary of the workshop proceedings (as well as summaries of the speakers' presentations), and an analysis of the participating federal agencies' research portfolios.

There is a growing knowledge base in understanding the differences and similarities between women and men, as well as the diversities among women and sexualities. Although genetic and biological characteristics define human beings conventionally as women and men, their experiences are contextualized in multiple dimensions in terms of gender, sexuality, class, age, ethnicity, and other social dimensions. Beyond the biological and genetic basis of gender differences, gender intersects with culture and other social locations which affect the socialization and development of women across their life span. This handbook provides a comprehensive and up-to-date resource to understand the intersectionality of gender differences, to dispel myths, and to examine gender-relevant as well as culturally relevant implications and appropriate interventions. Featuring a truly international mix of contributors, and incorporating cross-cultural research and comparative perspectives, this handbook will inform mainstream psychology of the international literature on the psychology of women and gender.

This volume provides the most comprehensive and up-to-date compendium of theory and research in the field of human intelligence. Each of the 42 chapters is written by world-renowned experts in their respective fields, and collectively, they cover the full range of topics of contemporary interest in the study of intelligence. The handbook is divided into nine parts: Part I covers intelligence and its measurement; Part II deals with the development of intelligence; Part III discusses intelligence and group differences; Part IV concerns the biology of intelligence; Part V is about intelligence and information processing; Part VI discusses different kinds of intelligence; Part VII covers intelligence and society; Part VIII concerns intelligence in relation to allied constructs; and Part IX is the concluding chapter, which reflects on where the field is currently and where it still needs to go.

This book examines the impact of gender on the choice of conflict management styles of managers in Bangladesh. It explores the influence of contextual factors, including the present socio-cultural and economic changes taking place in Bangladesh, on the choice of conflict management styles of managers in Bangladesh and the factors that might create gender differences in managerial styles. In doing so, the book includes factors such as age, education, managerial hierarchy, gender role orientation, and gender stereotyped organisational environment, as well as biological sex. The book suggests that exhibiting socially expected roles and using conflict management modes do not occur in vacuums. Both factors are intensely affected by socio-cultural expectations governed by a rigid patriarchal system, organisational processes, and the magnitude of individuals' unsatisfied needs. All these factors in various combinations affect the managerial styles of managers, and female managers imitate the well-accepted male managerial styles as a survival mechanism in the workplace. This results in no apparent gender differences in the preference of conflict management styles among managers, though the reasons for choosing a particular style may not be the same for females and males. This book also asserts that globally, organisations are steadily moving away from a mechanistic approach to a more humanistic approach, and with this changing management trend organisations have started appreciating the much-condemned 'feminine quality of relationship-oriented managerial style'. The book maintains that this gradual shift is also taking place in Bangladeshi organisations for certain jobs and organisations, and females are becoming sought-after employees. The cumulative effects of all these rapid changes transforming the socio-economic and socio-cultural expectations of the Bangladeshi population are leading to calls for urgent attention to the study of their long-term effects on patriarchy and gender relations in the workplace. This book is a step forward in that direction.

Although women have made important inroads in science and engineering since the early 1970s, their progress in these fields has stalled over the past several years. This study looks at women in science and engineering careers in the 1970s and 1980s, documenting differences in career outcomes between men and women and between women of different races and ethnic backgrounds. The panel presents what is known about the following questions and explores their policy implications: In what sectors are female Ph.D.s employed? What salary disparities exist between men and women in these fields? How is marital status associated with career attainment? Does it help a career to have a postdoctoral appointment? How well are female scientists and engineers represented in management? Within the broader context of education and the labor market, the book provides detailed comparisons between men and women Ph.D.s in a number of measures: financial support for education, academic rank achieved, salary, and others. The study covers engineering; the mathematical, physical, life, and social and behavioral sciences; medical school faculty; and recipients of National Institutes of Health grants. Findings and recommendations in this volume will be of interest to practitioners, faculty, and students in science and engineering as well as education administrators, employers, and researchers in these fields.

A dynamic and contextualized account of the processes and mechanisms underlying gendered career decisions and attainment across the life course.
