In signals and systems the concept of bounded-input bounded- output (BIBO) stability is introduced Satisfying this de finition requires that every bounded-input ($\sum |x_n| < \infty$) produces a bounded output ($\sum |y_n| < \infty$) For LTI systems a fundamental theorem states that a system is BIBO stable if and only if $\sum |h_n| < \infty$.

Linear Time Invariant (LTI) Systems . The system is linear time-invariant (LTI) if it satisfies both the property of linearity and time-invariance. This book will study LTI systems almost exclusively, because they are the easiest systems to work with, and they are ideal to analyze and design. Other Function Properties

6.003 covers the fundamentals of signal and system analysis, focusing on representations of discrete-time and continuous-time signals (singularity functions, complex exponentials and geometrics, Fourier representations, Laplace and Z transforms, sampling) and representations of linear, time-invariant systems (difference and differential equations, block diagrams, system functions, poles and zeros, convolution, impulse and step responses, frequency responses).

In system analysis, among other fields of study, a linear time-invariant system is a system that produces an output signal from any input signal subject to the constraints of linearity and time-invariance; these terms are briefly defined below. These properties apply to many important physical systems, in which case the response y of the system to an arbitrary input x can be found directly using convolution: $y = x * h$ where h is called the system's impulse response and $*$ represents convolution.

Part of learning about signals and systems is that systems are identified according to certain properties they exhibit. Have a look at the core system classifications: Linearity: A linear combination of individually obtained outputs is equivalent to the output obtained by the system operating on the corresponding linear combination of inputs.

In terms of system theory, the problem is to find the system that changes the transmitted signal into the received signal. At first glance, it may seem an overwhelming task to understand all of the possible systems in the world. Fortunately, most useful systems fall into a category called linear systems. This fact is extremely important. Without the linear system concept, we would be forced to examine the individual characteristics of many unrelated systems.

~~Signals and Systems – Digital Signal Processing~~

Signal processing is an electrical engineering subfield that focuses on analysing, modifying, and synthesizing signals such as sound, images, and scientific measurements. Signal processing techniques can be used to improve transmission, storage efficiency and subjective quality and to also emphasize or detect components of interest in a measured signal.
