Capital Asset Pricing Model (CAPM)

In finance, the capital asset pricing model is a model used to determine a theoretically appropriate required rate of return of an asset, to make decisions about adding assets to a well-diversified portfolio. The model takes into account the asset's sensitivity to non-diversifiable risk, often represented by the quantity beta in the financial industry, as well as the expected return of the market and the expected return of a theoretical risk-free asset. CAPM assumes a particular form of utility

Read Online The Capital Asset Pricing Model Capm

The capital asset pricing model (CAPM) provides a useful measure that helps investors determine what sort of investment return they deserve for putting their money at risk on a particular stock.

Explaining The Capital Asset Pricing Model (CAPM)

The Capital Asset Pricing Model (CAPM) is a model that describes the relationship between the expected return. Expected Return The expected return on an investment is the expected value of the probability distribution of possible returns it can provide to investors. The return on the investment is an unknown variable that has different values associated with different probabilities.

What is CAPM - Capital Asset Pricing Model - Formula, Example

Capital Asset Pricing Model (CAPM) is a measure of the relationship between the expected return and the risk of investing in security. This model is used to analyze securities and pricing them given the expected rate of return and cost of capital involved.

CAPM (Capital Asset Pricing Model) - Definition, Formula ...

The capital asset pricing model (CAPM) is widely used within the financial industry, especially for riskier investments. The model is based on the idea that investors should gain higher yields when investing in more high-risk investments, hence the presence of the market risk premium in the model's formula.
